

RX-AURA

**RazorpayX Autonomous Unified
Resolution Agent**

**Razorpay 2026 Buildathon - By
Vaidhavy Aditi**

The Problem

There is a delay issue and people ARE TALKING ABOUT IT!

Have you ever wondered why finance teams spend **half their day chasing vendors on WhatsApp** when a payment bounces?

A failed payout creates a cross-system exception loop. **Razorpay → Finance/Ops → Vendor → Verification → ERP → Razorpay → Human approval.** The payment may be automated but **The recovery workflow isn't.**

Finance teams still rely on email, WhatsApp, internal tools and manual coordination to resolve payout and vendor payment exceptions. **RAZORPAY DOESN'T HAVE A PAYOUT PROBLEM. IT HAS AN EXCEPTION RESOLUTION PROBLEM.**

Payouts **fail for dozens of reasons:** invalid IFSC codes, name mismatch, lack of funds, etc. Banking portals only spit out cryptic error codes. **Different failure → different recovery.**

The manual recovery loop: **Identify why the payout failed → Find the vendor and invoice → Contact the vendor → Collect corrected bank details → Verify the information → Update the ERP → Re-create the payout → Approve the payment**

The Solution

What if the exception could resolve itself? Meet **RX-AURA**. An **autonomous RazorpayX exception-resolution agent** for **B2B vendor payouts**.

The goal is **SELF-HEALING PAYOUTS**.
HUMAN-CONTROLLED MONEY MOVEMENT.

Detect — catches failed payments in real time, **Diagnose** — identifies the failure and recovery path, **Communicate** — contacts the vendor and collects missing information, **Verify** — validates corrected banking details, **Synchronize** — updates the ERP, **Prepare** — stages the replacement payout, **Approve** — human authorizes the final financial action

AI DOES NOT CONTROL THE MONEY. RazorpayX moves the money. A **LLM** reasons, extracts and communicates. A **Policy Engine** permits or blocks actions. The **State Machine** controls the workflow and of course the **Human** authorizes financial execution.

The agent can **investigate exceptions, understand vendor responses, extract banking information and select permitted recovery actions**. However, it **cannot bypass policy, invent bank details, override validation or execute an unauthorized payout**.
